PHAROS
Pharmaceutical Alerts & Regulatory Observation System

The PHAROS Handbook

Screening by ingredient and by authority, what follows a finding, and the record

Prepared for

Dr Sama Mosaad

Qualified Person for Pharmacovigilance · Administrator of PHAROS

Where the name PHAROS comes from

ALEXANDRIA, EGYPT

Φάρος

Pharos, an island off Alexandria

280 BC	the lighthouse is built
1,500+	years it stood
1 of 7	ancient Wonders of the World

Pharos was a small island off Alexandria. Around 280 BC a great lighthouse was built there. Its fire guided ships safely into the harbour for more than 1,500 years. Its name became the word for a lighthouse in many languages: *phare* in French, *faro* in Italian and Spanish.

Our PHAROS does the same job. A lighthouse does not steer the ship. **It keeps the light on, so we never sail on in the dark.**

The letters spell its full name: **Ph**armaceutical **A**lerts & **R**egulatory **O**bservation **S**ystem.

THE ENGINE · IT RUNS BY ITSELF, DAY AND NIGHT

1 Read
The 25 reference authorities and others, our mailbox, PubMed and PubMed Central.

2 Keep
Every new item and its PDFs, in its own language, in a locked archive.

3 Find
Our ingredients and their drug classes, by every name, in every language.

4 Show
On the Ingredients and Sources tabs, and in a Telegram message.

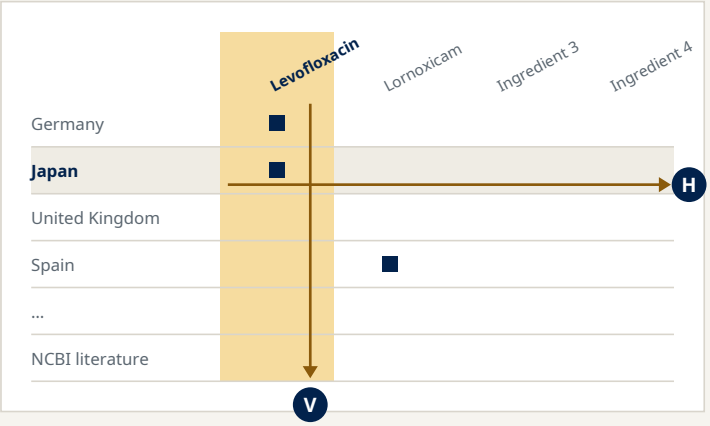

5 Report
Every Sunday at 05:00 Cairo, the week before, as PDF and Excel.

01 How PHAROS screens

PHAROS replaces the manual screen of regulatory safety information for the active ingredients we market. It reads, keeps and finds. A person reads what it found, and decides.

V The vertical pass

INGREDIENTS TAB

By ingredient. Take one active ingredient and look in every source: the 25 reference authorities, the other authorities, and NCBI literature (PubMed and PubMed Central), for the days you choose. The question: did anyone, anywhere, mention it, and where? The search includes the ingredient's drug class, because many class-wide notices never name the ingredient.

H The horizontal pass

SOURCES TAB

By authority. Take each authority and read everything it newly published, by eye: news, safety alerts, DHPC letters, new PDFs, whether or not it names our ingredients. It is the safety net for whatever the vertical pass misses.

THE TABS

Ingredients

The watchlist, and for each ingredient its screen: every source, for the days you choose. The vertical pass. It is the page PHAROS opens on.

Sources

One card per country: the pages you check and what was published since you last looked. The horizontal pass. Its tab says how many items are new.

Reports

The weekly report, PDF and Excel, with its fingerprints and signatures; packs on request; the screening log of every check of every source.

People and Me

People, for administrators: who may sign in. Me, your name at the top right: Telegram, password, light or dark.

WHEN PHAROS READS

WHEN	WHAT
Every 4 hours, day and night	The authorities' news feeds, web pages and lists, and the pharmacovigilance mailbox, where the newsletters that come only by e-mail arrive.
Twice a day	Sites that can only be read with a full browser, and the slower lists.
Three times a day	NCBI literature (PubMed and PubMed Central), drug classes from the ATC code and the check of the past (page 3). Early morning only: the large lists (EMA's, the EURD list).
Every Monday	The label watch: changes to the product information (SPC) of products with our ingredients. Then EMA's literature monitoring list.
Every day, from 07:00 Cairo	Telegram. After 07:00, the reminder of findings due to the Egyptian Drug Authority and of signal steps due (page 9). After 09:00, the class digest, with the possible case reports, and the new items.
Every Sunday, 05:00 Cairo	The weekly report, for the week that has just ended.

GOOD TO KNOW

The week

Weeks run Sunday to Saturday, Cairo time. Every date and time on screen and in the reports is Cairo local time.

A site that refuses PHAROS

PHAROS never forces its way in. Such a site is read from its e-mail newsletter, or its page is marked **Not read by the app — open it yourself**.

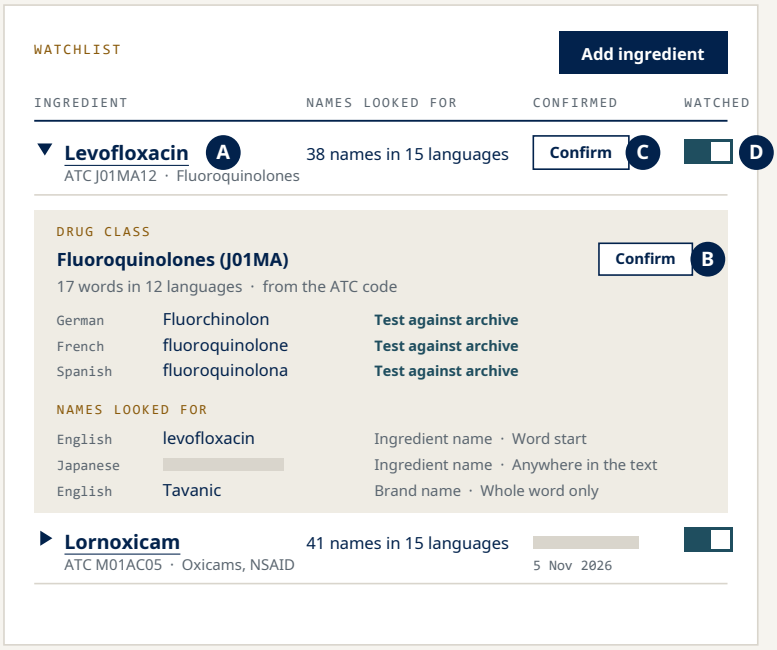

Titles as published

Every title stays in its own language, exactly as the authority wrote it. A link always opens the authority's own page, never a data feed.

02 Ingredients: the watchlist

A DRAWING, NOT REAL DATA

Every active ingredient we watch, looked for under every name it carries, in each regulator's own language, and by the words of its drug class.

HOW TO ADD AN ACTIVE INGREDIENT

1. Press **Add ingredient**.
2. Type its name in any language or spelling, at least three letters.
3. Pick the right one from the list: each shows its ATC code. Then press **Confirm**, which carries its name and code.
4. Check the names suggested for each language. Add brand names, remove wrong ones. **Never when it is** keeps look-alike drugs out.
5. Press **Test against archive** on a name: how many stored notices contain it.
6. Press **Save**. Nothing is saved before this. Its row then says Ready, or Still preparing (page 4).
7. In the table, press **Confirm** to record that you checked it.

A The name
Opens the ingredient's screen.

B Drug class
Its words in each language.

C Confirm
Records your name and the date.

D Watched
Off pauses it, keeping its names.

Drug class words

FROM THE ATC CODE UNTIL YOU CONFIRM

Many safety notices speak of a whole class (fluoroquinolones, NSAIDs) and never name the ingredient. So each ingredient also carries its drug class: its ATC group (levofloxacin J01MA12 belongs to Fluoroquinolones, J01MA), with the words notices use for that class in each regulator's language. The next class run (three a day) makes the class from the ATC code. It reads **from the ATC code** until an administrator checks its words and presses **Confirm**.

1. Press the triangle beside the ingredient's name, then click the class line to list its words by language.
2. Press **Test against archive** beside a word: “12 archived notices contain it”.
3. To add a word, choose its language, type it as notices write it, and press **Add word**. **Remove** takes a wrong word out.
4. When the words are right, press **Confirm**. Your name and the date are recorded.

In its own language

A class word is looked for only in notices written in its language.

Marked By class

A notice that names only the class goes to the daily digest, never an immediate message. On screen it is marked **By class**.

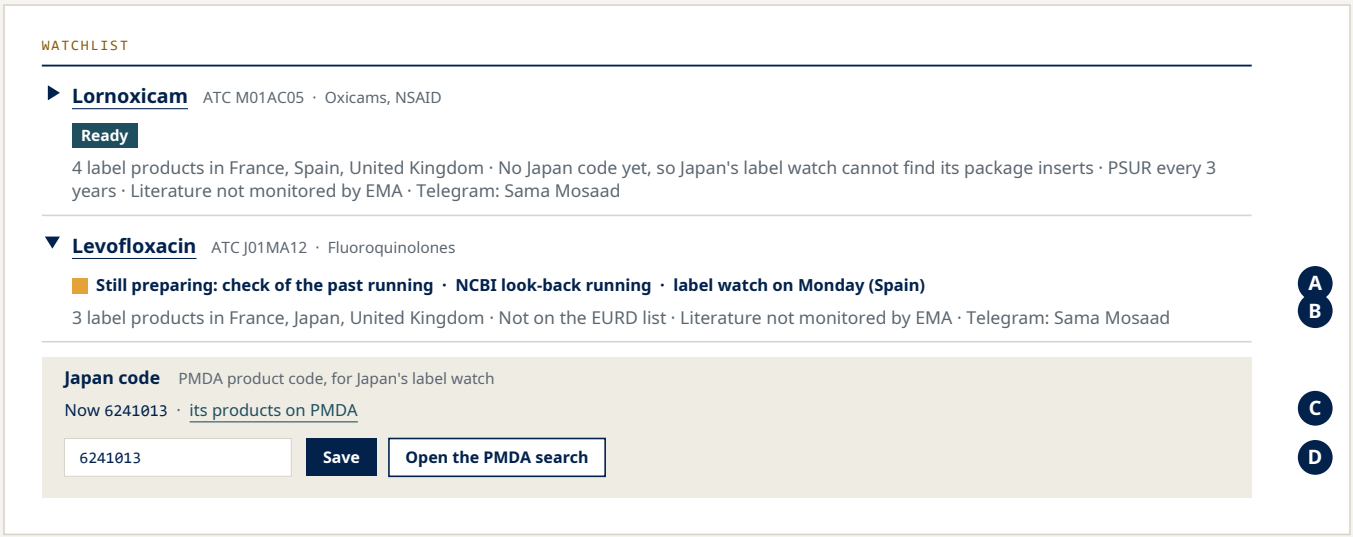

The check of the past

A new name or class word is also checked against the stored notices of the last 12 months. What it finds is marked **History** and sends no message.

Any ingredient she adds is covered

A DRAWING, NOT REAL DATA

Nothing more is asked after Save. Under its name, each ingredient's row says how far PHAROS has got in preparing it, and every part clears by itself.

A The line — Ready, or Still preparing.

B Under it — Labels, EURD, EMA, Telegram.

C Japan code — The one it has now.

D PMDA search — Where the code is found.

WHAT THE LINE SAYS, AND WHEN IT CLEARS BY ITSELF

WHAT THE ROW SAYS	WHAT IT MEANS
Ready	Its names, its class words, the check of the past, the NCBI look-back and the label watch are all done, and someone receives its Telegram messages.
class words waiting	It has an ATC code and no drug class yet. The next class run makes it (three a day).
check of the past running, or waiting	Its names are checked against the stored notices of the last 12 months. It clears when every name is checked.
NCBI look-back running, or waiting	PubMed and PubMed Central are read 12 months back for its name and class words. A large look-back takes a few days.
label watch on Monday (Spain)	The countries whose label watch has not read since it was added. Monday's run reads them; a country with no product of it is an answer too.
nobody receives its Telegram messages yet	Nobody with Telegram is subscribed to it. Dr Sama Mosaad receives every ingredient's messages, so this clears the moment it is saved.

Under the line, and never holding Ready back: the label products found and where, the Japan code, the EURD list's PSUR frequency, data lock point and submission date, whether EMA's literature monitoring covers it, and who receives its messages. The weekly report repeats each line in section 01.

The Japan code

ADMINISTRATORS

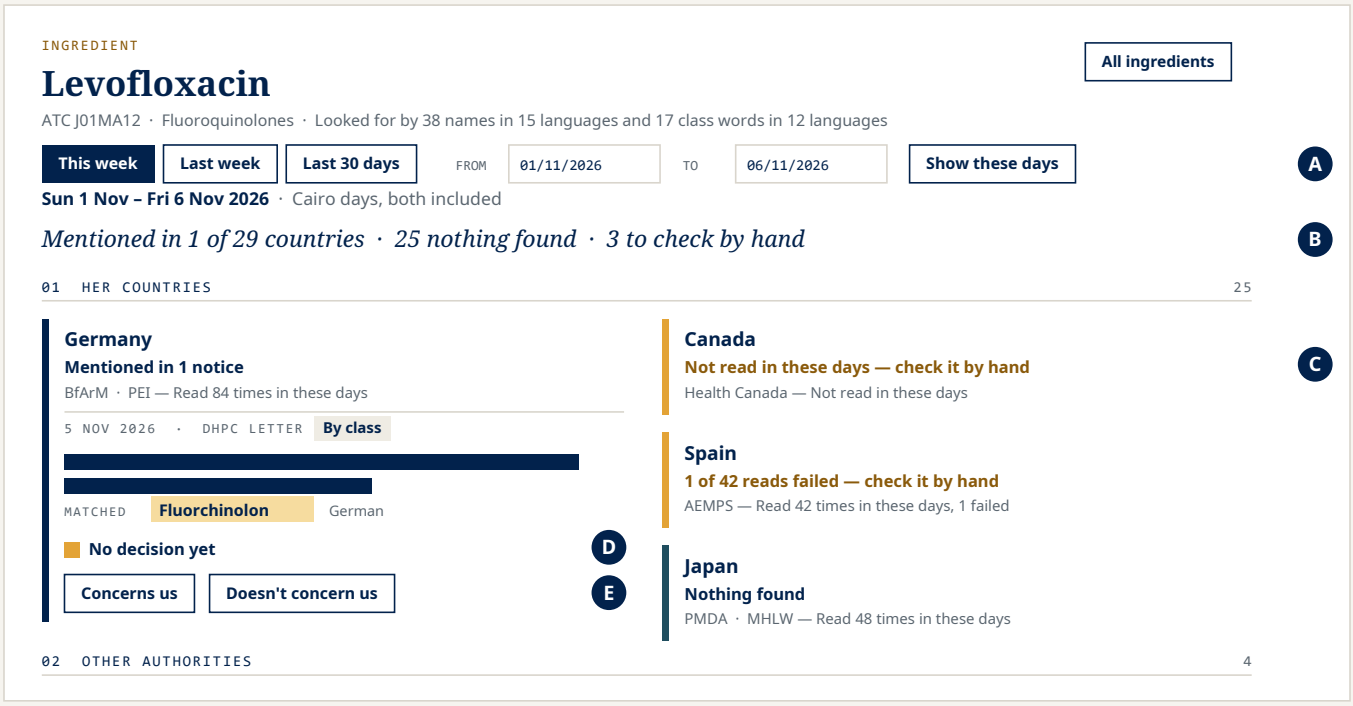

PMDA's search answers a form, not an address, so PHAROS cannot look a Japanese package insert up by name. One code per ingredient lets Japan's label watch find them. Without it the row says so; the ingredient is still watched everywhere else.

1. Open the ingredient's row: the triangle beside its name. Under **Japan code**, press **Open the PMDA search**.
2. Search the name, open the product, and copy the code from the end of its address: .../GeneralList/**6241013** for levofloxacin.
3. Paste it and press **Save**. Seven characters; the 12-character YJ code is accepted and kept as the seven it starts with.
4. The row shows **Now 6241013 · its products on PMDA**. Japan's label watch uses it at its next weekly run.

One ingredient, every source

A DRAWING, NOT REAL DATA

Click an ingredient's name. For the days you choose, the screen answers one question for every country: was it mentioned, and where?

A **The days** This week is the default.

B **In one line** How many countries, each answer.

C **One country** Her countries first.

D **One notice** Its title opens the authority's page.

E **The decision** Two buttons on every finding.

THE ANSWER FOR EACH COUNTRY

WHAT THE COUNTRY SAYS	WHAT IT MEANS
Mentioned in N notices	The ingredient, or a word of its class, is in N notices of these days. Read each one and record a decision.
Nothing found	Every read of these days worked and every page of hers is read by the app. Nothing to do.
N of M reads failed — check it by hand	Some reads failed, so nothing found is not a sure answer. Her pages open folded out: look at them yourself.
Not read in these days — check it by hand	The app did not read this country in these days. Open her pages and look.
A page of hers is not read by the app — check it by hand	Nothing found where it reads, but one of her pages it cannot read. Open that page.

HOW TO RECORD A DECISION

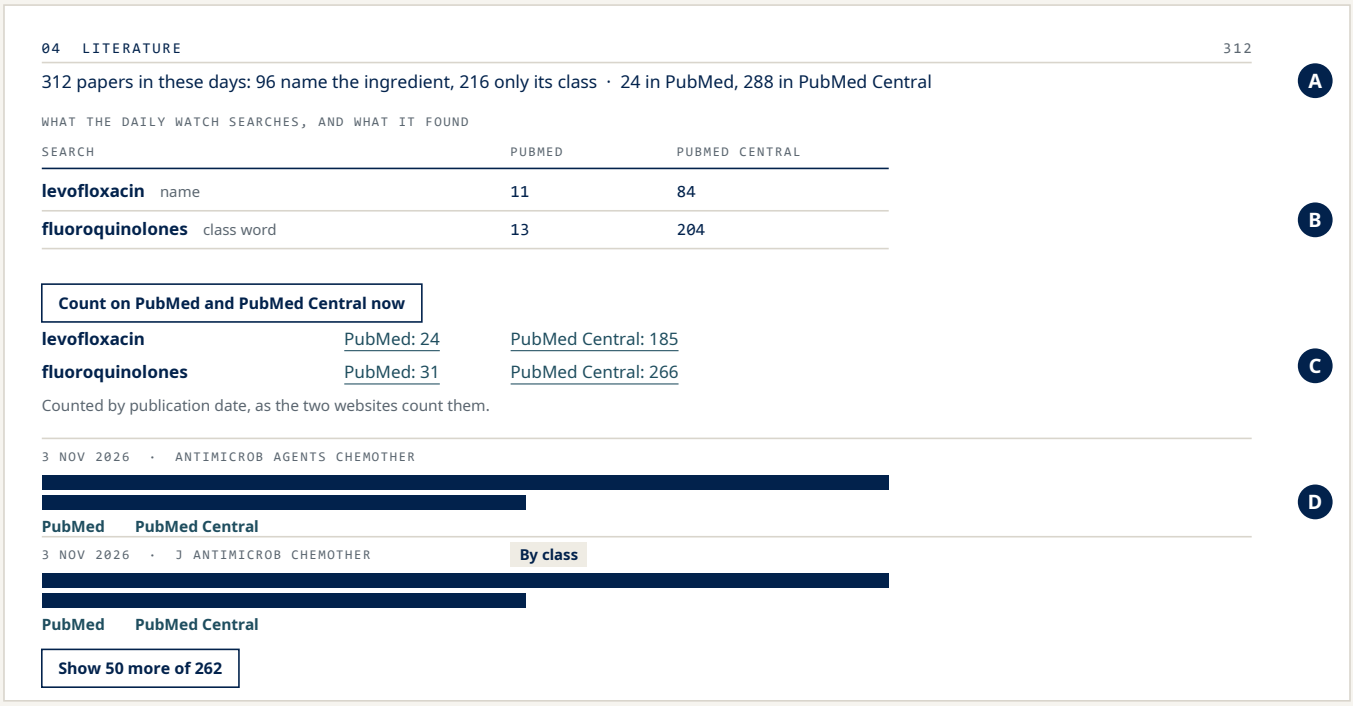

1. Open the notice's title: it is the authority's own page. An e-mail with no page opens with **Read the e-mail**.
2. Check the matched words. **By class** means only a class word matched.
3. Press **Concerns us** or **Doesn't concern us**.
4. Write why. For Doesn't concern us the reason is required; for Concerns us a comment is optional.
5. Press **Record**. Your name and the time are saved, on every mention of that notice.
6. To change it later, press **Change** and record a new decision. The earlier one is kept.

Readers see the decisions; reviewers and administrators record them. A decision is never edited or deleted. **Concerns us** brings the five-day clock and the signal (pages 9 and 10).

NCBI literature: PubMed and PubMed Central

A DRAWING, NOT REAL DATA

At the foot of every ingredient's screen. PubMed and PubMed Central are searched every day, by the ingredient's name and its class words, the way you search them on the NCBI websites.

A Stored papers
Found by the daily watch.

B The searches
What is searched, and what each found.

C Count now
Live counts; each opens the same search.

D Papers
50 at a time, each with its links.

HOW THE SEARCH IS MADE

What	Every day, for each watched ingredient: its English name, and each English word of its drug classes. On PubMed, and on PubMed Central (full texts).
How	Typed exactly as a person types it on the NCBI websites: no quotes, no field tag, so NCBI expands it the same way. Every page of results is read.
Once	A paper in both databases is kept once, with both links and the two decision buttons of its notice.
New words	A new ingredient or class word first reads the last 12 months. What that finds is marked **History**.
Telegram	Papers are read here and in the weekly report, never sent one by one, so the authorities' notices are not buried under them. Only a possible case report goes in the daily message (page 7).

HOW TO SEE THAT PHAROS AND NCBI AGREE

1. Set the days with **From** and **To**, and press **Show these days**.
2. Press **Count on PubMed and PubMed Central now**.
3. Press a count. The same search, for the same days, opens on the NCBI website. The numbers are the same.

The stored papers can differ from the live counts: the daily watch reads by the day NCBI added a paper, the live counts go by publication date, as the websites count.

Label changes

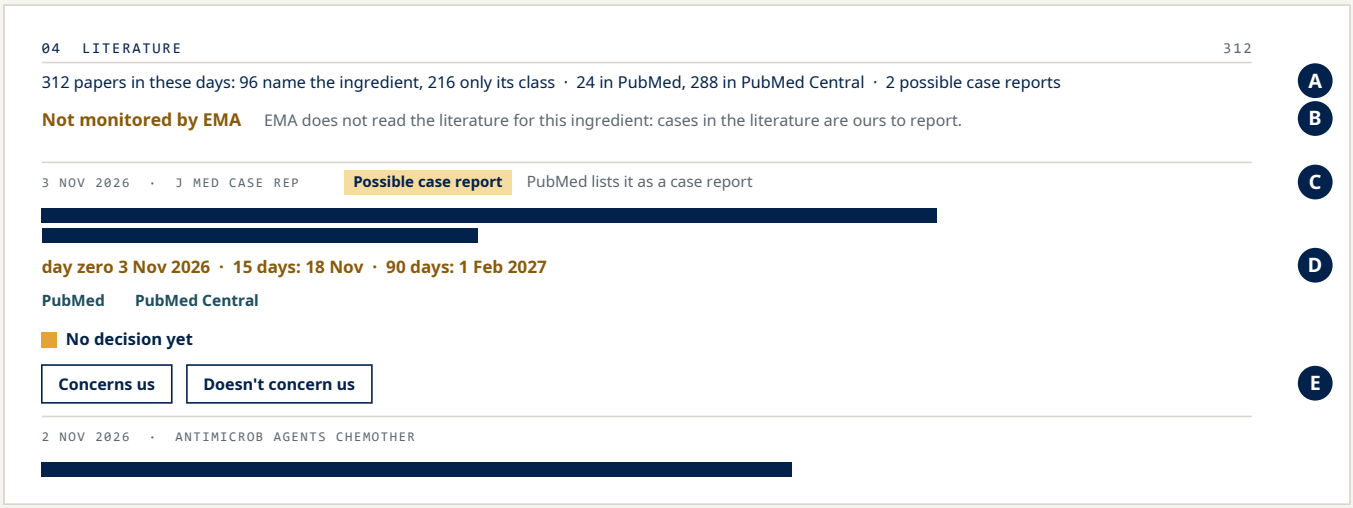

03 ON THE INGREDIENT'S SCREEN

The weekly label watch reads the product information (SPC) of products with our ingredients. A change detected in the days you chose is listed under **Label changes**, with the sections that changed, what the originator added set against our own label (page 8), and the same two decision buttons.

Case reports in the literature

A DRAWING, NOT REAL DATA

A paper that reports a case with one of our ingredients starts its own clock: a valid serious case reaches the Egyptian Drug Authority within 15 days, a non-serious one within 90.

A In one line
How many look like case reports.

B EMA
Whether EMA reads it for us.

C The flag
And why it was raised.

D The dates
From the day PHAROS found it.

E The decision
As on every notice.

HOW A PAPER IS FLAGGED

PubMed lists it as a case report	Its PubMed publication type is Case Reports. For a paper PubMed Central alone found, PHAROS reads its PubMed record too.
Its title says so	Its title says “case report”, “case series” or “a case of”.
Day zero, 15 days, 90 days	Day zero is the Cairo day PHAROS first found the paper, never its publication date. 15 days for a valid serious case, 90 for a non-serious one.
Not monitored by EMA	From EMA's medical literature monitoring list, read every Monday. When EMA does not monitor the ingredient, its cases in the literature are ours to report.

PHAROS · possible case reports · 4 Nov 2026

Possible case reports (1)

- [redacted]
  J Med Case Rep · day zero 3 Nov 2026 · 15 days: 18 Nov 2026
  Open the ingredient

IN THE DAILY MESSAGE, AFTER 09:00 CAIRO

WHAT TO DO WITH A POSSIBLE CASE REPORT

1. Open **PubMed** and read the paper. Is it a valid case for one of our products?
2. Press **Concerns us**, with a comment, or **Doesn't concern us** with the reason. The decision shows on every paper of the same notice.
3. Concerns us also brings the five-day clock and the signal under the decision (pages 9 and 10).

The daily message

Each possible case report naming an ingredient is sent once, at the end of the class digest. A paper found only by a class word, or by a look into the past, never is.

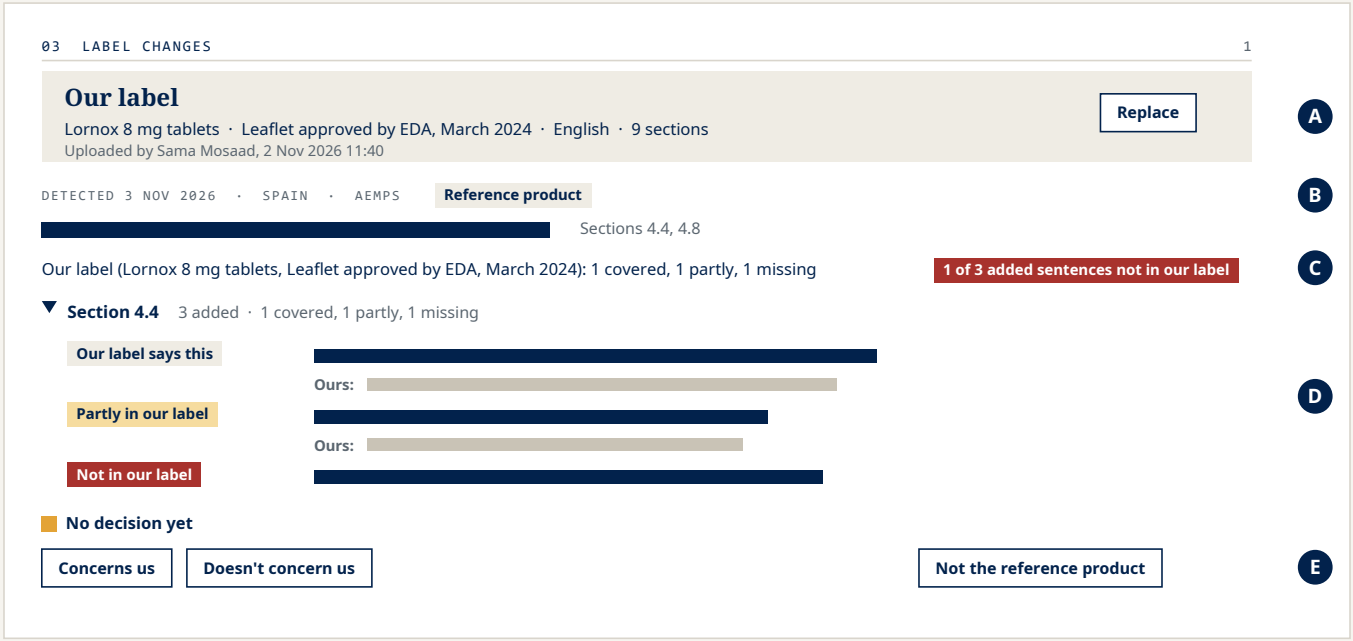

The weekly report

Section 04 lists the possible case reports first, with day zero, both dates and the decision. The summary counts those with no decision yet.

Our label under Label changes

A DRAWING, NOT REAL DATA

Each label change the label watch finds is set against our own approved label, sentence by sentence: what the originator added, and whether our label already says it.

A Our label
The version in use.

B The change
Reference product first.

C In one line
Covered, partly, missing.

D Each sentence
Theirs, and our closest.

E The decision
And the reference mark.

HOW TO UPLOAD OUR LABEL

1. On the ingredient's screen, under **Label changes**, press **Upload our label** (or **Replace**). Reviewers and administrators.
2. Give the **Product** (name and strength), the **Version** (which approval) and the **Language** (en, ar, fr).
3. Choose the PDF or text file, or paste the text. A PDF is read on this computer; only the sections found are saved.
4. Check **Sections found**. At least one safety section, 4.1 to 4.9, is needed; each heading starts its own line.
5. Press **Save this version**. It is compared with the label changes of the last year within 4 hours, on the next collection run. The version before stays on record.

THE WORDS BESIDE EACH ADDED SENTENCE

Our label says this	Three quarters or more of its words are in one sentence of ours, shown after Ours.
Partly in our label	Some of its words are in one sentence of ours. Read both.
Not in our label	Few or none of its words are in that section of ours.
Not compared	Our label is in another language: labels are never compared across languages, so compare them by eye. Or our label was just uploaded, and the next run compares it.

The reference product

One product per ingredient, the originator's as a rule: **Mark as the reference product**. Its changes come first, on screen and in the weekly report.

By the day it was found

A change counts in the days it was detected, not on the date printed on the label.

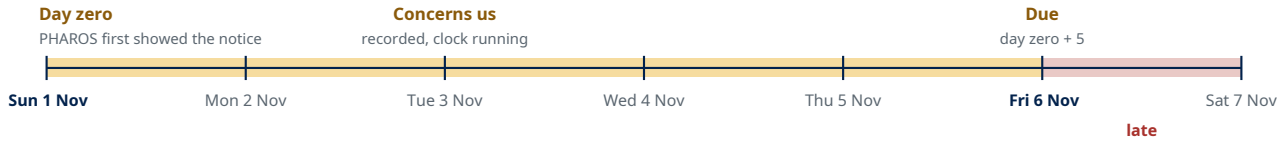

In the weekly report

Under each ingredient, one line: “Our label: 2 covered, 1 partly, 1 missing”, or why it was not compared.

03 The five-day clock to the authority

A DRAWING, NOT REAL DATA

A finding that concerns us must reach the Egyptian Drug Authority within five days. PHAROS keeps that clock for each notice, in one line under its decision.

HOW TO RECORD THAT IT WAS SENT

1. Press **Sent to the authority**. Reviewers and administrators see it while the clock runs or is late.
2. Give the **Day sent**: from day zero to today, nothing else. A **Reference** (the authority's or our file number) and a **Note** are optional.
3. Press **Record: sent to the authority**. The clock stops on every mention and paper of the notice, with "Recorded by" and the note under it.

A The clock
One line under the decision.

B Sent
While it runs or is late.

C The form
Day, reference, note.

WHAT THE LINE UNDER THE DECISION SAYS

Authority: due Fri 6 Nov, 3 days left	The clock runs. On the day itself: "due today".
Authority: late by 2 days (was due Fri 6 Nov)	Past the due day and not sent yet.
Sent to the authority 5 Nov 2026 · ref EDA/2026/0042	Recorded as sent: the clock has stopped.
Nothing	The latest decision is not Concerns us.

Never forgotten

A report is never changed or deleted. If the decision becomes Doesn't concern us the clock goes off, but the report stays: Concerns us again finds the notice sent.

Withdrawing

A report recorded by mistake: **Withdraw the report**, with the reason. It stays on record as withdrawn, and the clock runs again from the same due day.

The morning reminder

After 07:00 Cairo, every reviewer and administrator with Telegram gets one message: the findings late or due within 2 days. Nothing when nothing is due.

Today is the Cairo day of the PHAROS server, never the phone's. The weekly report shows what was reported to the authority in the week, how many findings are due and late, and on each decision its due day and the day it was sent.

WHO DOES WHAT AFTER A DECISION

Reader	Sees the decision, the clock line, the signal, its stages and its history. No buttons.
Reviewer	Decides Concerns us or Doesn't concern us, records the report as sent or withdraws it, takes every signal step, and uploads our label.
Administrator	All a reviewer does, and asks for inspection packs (page 14).

Signal steps inside the finding

A DRAWING, NOT REAL DATA

A finding that concerns us is also a signal to take through validation, assessment and action. PHAROS opens it from the decision and keeps it under the finding, so nothing is filled in twice.

A The signal
Its reference and next due day.

B The stages
The current one lit.

C The next step
One form, words required.

D The history
Who, when, and what they wrote.

THE STAGES, AND THE STEP EACH ONE WAITS FOR

Validate	**It is a signal**, with its priority and why; or **Not a signal**, with why, which closes it. Due 30 days after it was opened.
Assess	**Record the assessment**: the outcome and the conclusion. Refuted, Keep monitoring and No action needed close it. Update our label, Update the RMP, Send a DHPC and Report in the next PSUR open an action, with the day it is due. Due 30, 60 or 90 days after validation, by priority.
Action	**Action done**: what was done, with its reference. It closes the signal.
Closed	**Reopen**, with why.

Opened once

Concerns us opens the signal, named after the notice, for its ingredient, by the person who decided. Concerns us again later opens no second one.

If the decision changes

Still at Validate with no step taken, Doesn't concern us closes it as not validated: “Decision changed:” and the reason. Validated, it stays open.

Late, and the reminder

Past the due day the line says **late**. The morning message lists the steps late or due within 2 days, after the findings.

Every step needs words for the record and is never edited. If two people take a step at once, the second is refused and the screen reloads. Readers see the stages and the history, without buttons. A paper filed under a notice shows the same clock and steps. The weekly report gives each decision its signal and counts the signals open and the steps late.

ONE SIGNAL, FROM THE DECISION TO THE END

1. **3 Nov.** Sama Mosaad marks the notice Concerns us. SIG-2026-001 opens at Validate, due 3 Dec, and the five-day clock shows under the decision.
2. **4 Nov. It is a signal**, High priority, with why. Assess by 4 Dec.
3. **20 Nov. Record the assessment**: Update our label, with the conclusion and the day the action is due.
4. **The day it is done. Action done**, with what was done and its reference. The signal is closed; its history stays.

04 Sources: every authority, by eye

A DRAWING, NOT REAL DATA

One card per country, her 25 countries first, then other authorities: the pages you check, and everything its authorities published since you last looked.

A The tab — New items, all countries.

B Her pages — Read by the app, or not.

C Mark as looked at — The count starts again.

D New items — Date, title as published.

E This week — New and Matched open the items.

THE HORIZONTAL PASS, COUNTRY BY COUNTRY

1. Open **Sources**. Its tab says how many items are new since you last looked.
2. On each card, read **New since you last looked**: every item, with its date and its title in its own language. Open a title to read the authority's own page.
3. An item marked **Matches a watched ingredient** is also on that ingredient's screen: record the decision there.
4. Open each page marked **Not read by the app — open it yourself**, and look at it.
5. Press **Mark as looked at**. The count starts again from now, for you only, for every authority of that country.

WHAT THE MARKS ON HER PAGES MEAN

Read by the app	PHAROS reads the page and lists what is new on it.
Read by the app, by e-mail subscription	The site refuses PHAROS, so its newsletter is read from the pharmacovigilance mailbox instead.
Partly read by the app	PHAROS reads part of the page. Its note says what to look at by hand.
Not read by the app — open it yourself	PHAROS cannot read it. Open it and look; the weekly report lists it under To check by hand.

Since when

Since you last pressed Mark as looked at. The first time, since Sunday 00:00 Cairo. Never more than 31 days back.

Items that came by e-mail

An item with no web page opens with **Read the e-mail**. **Save the original e-mail** keeps the message.

For administrators

Read switches a source off or on. **Technical details** shows each source's address and last error. **Add a source** tests a link before saving it.

05 Reports: the weekly report

Our record that we screened, week by week. It is made for the SOP and the pharmacovigilance system master file.

Sunday 05:00
Made by itself every Sunday at 05:00 Cairo time.

Sun to Sat
The week that has just ended, Cairo days.

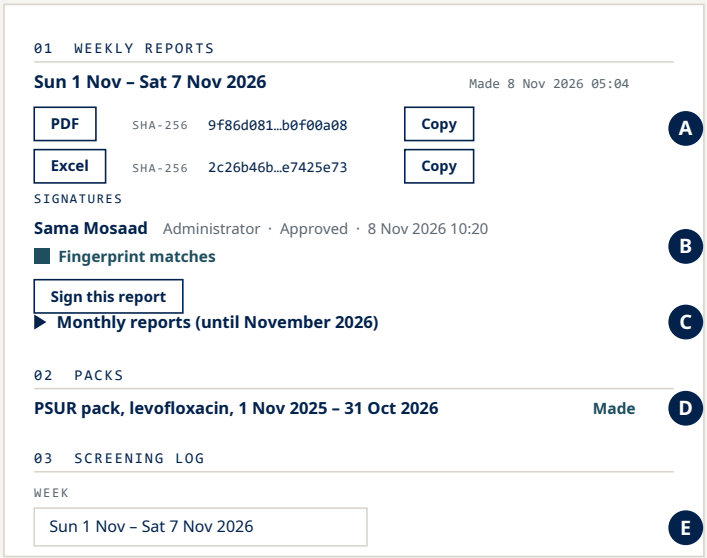

PDF and Excel
The same six sections in both files.

Never overwritten
Kept in a locked archive with its fingerprint.

THE SIX SECTIONS

	SECTION	WHAT IT HOLDS
01	**Summary**	The week's figures; every decision taken in it, with its due day, its report to the authority and its signal; and each ingredient: Ready, or Still preparing.
02	**Authorities read**	For each country, her 25 first: reads, reads that worked, reads that failed, new items. The label watch and literature too.
03	**Our ingredients by country**	For each watched ingredient, each country's answer. Every notice with its link, the words matched and the decision. Its label changes, set against our label.
04	**NCBI literature**	For each ingredient, the possible case reports first with their dates, each search with its counts, every paper with its links, and whether EMA monitors it.
05	**Everything new, per authority**	Every item each authority published in the week, and who looked at the country, and when.
06	**To check by hand**	Her pages the app does not read in full, the sources whose reads failed (with the last failure), and the sources not read that week.

The Excel file has the same, as sheets: Summary, Decisions, Authorities read, Ingredients by country, NCBI searches, NCBI papers, Everything new, To check by hand.

HOW TO FILE THE WEEKLY REPORT

1. Open **Reports**. Under **Weekly reports** the newest week is first.
2. Press **PDF**, then **Excel**, and file both with the screening records. **Copy** gives each file's SHA-256 to keep with it. Administrators also receive the PDF on Telegram on Sunday.
3. Press **Sign this report**: Reviewed or Approved, with your password (page 13).
4. Work through section 06, **To check by hand**: open each page it lists and look at it.
5. For any other week, choose it under **Screening log**: every check of every source, Sunday to Saturday, including checks that found nothing.

A The files Each with its SHA-256.

B Signatures Do they still match?

C Monthly Before Nov 2026.

D Packs On request (page 14).

E Screening log Pick any week.

Kept for inspection

Each file is kept in a locked archive with its SHA-256 fingerprint, the version of PHAROS that made it and the run that made it.

Made again, never replaced

A week made again is stored beside the first as a new version. Nothing is overwritten; the Reports page offers the latest.

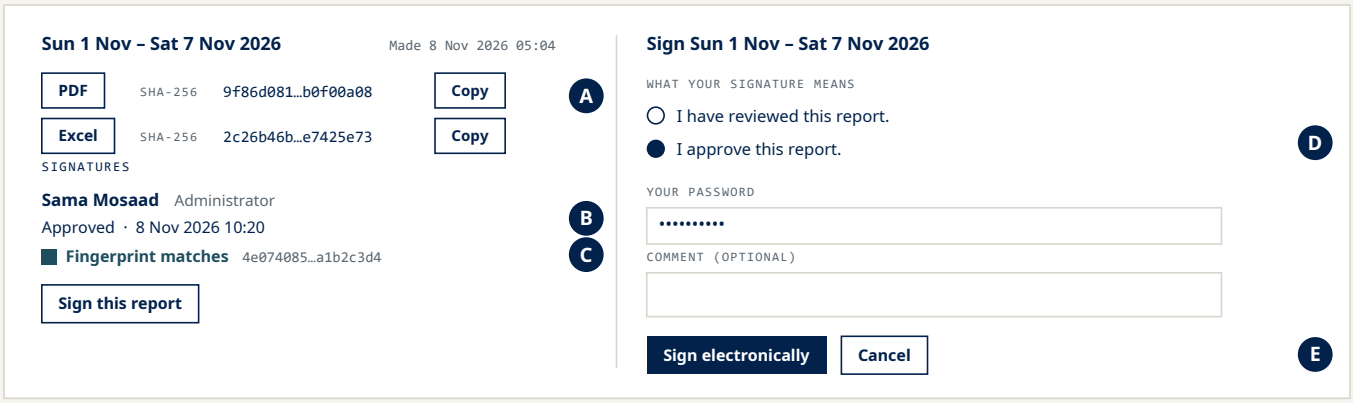

The five-day clock

The report comes after the week. A finding due to the Egyptian Drug Authority is followed by its clock on the Ingredients screen and the morning reminder (page 9).

Inspection evidence: fingerprints and signatures

A DRAWING, NOT REAL DATA

What an inspector can be shown for any week: the two files, their fingerprints, who signed them and what for, and a record of changes that nobody can alter.

A SHA-256 Shortened; Copy gives all 64.

B Signatures Name, role, meaning, time.

C The check Still the files signed?

D The meaning Reviewed, or Approved.

E Sign With your password.

HOW TO CHECK A FILE AGAINST ITS FINGERPRINT

1. Press **Copy** beside the file's SHA-256.
2. On the computer that holds the filed copy, run **certutil -hashfile <file> SHA256** (Windows) or **sha256sum <file>**.
3. The same 64 characters mean the same file, byte for byte.

HOW TO SIGN A WEEKLY REPORT

1. Press **Sign this report**. Reviewers and administrators; an administrator is offered Approved first.
2. Choose what your signature means, type your password, and add a comment if you wish.
3. Press **Sign electronically**. Your name, role, the meaning, the time and the report's fingerprint are recorded. It cannot be undone.

UNDER EACH SIGNATURE

Fingerprint matches	The report's files are the ones that were signed.
File changed since signing	The week was made again: new files, new fingerprints. Sign it again; the old signature stays.

WHERE EACH RECORD IS, WHEN AN INSPECTOR ASKS

One week's screening	Reports, 01 Weekly reports: the PDF and the Excel file, their SHA-256 and signatures.
What was checked, and when	Reports, 03 Screening log: every source, every run, and what it found.
One ingredient over its PSUR interval	Reports, 02 Packs: a PSUR pack (page 14).
Every decision and signature over a period	Reports, 02 Packs: an inspection pack, administrators only (page 14).

Your password

Signing asks for your password, and a sign-in with it in the last 5 minutes. If you sign in by e-mail link, first set a password under **Me**, then Password.

Never changed

A signature is never edited or deleted. The audit log of every change cannot be changed or emptied by anyone, the database's owner included.

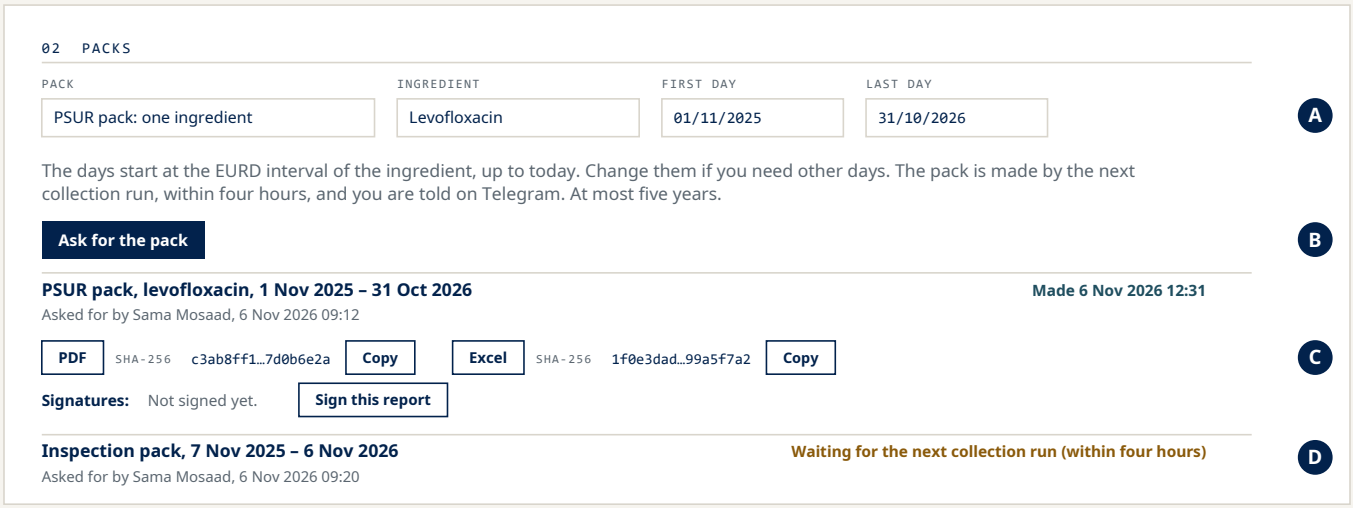

The archive check

Every Sunday PHAROS re-reads a sample of the originals, the weekly reports and the packs, checks each against its fingerprint, and tests that nothing can be overwritten.

Packs on request: PSUR and inspection

A DRAWING, NOT REAL DATA

A PSUR pack for one ingredient, or an inspection pack for the whole system: asked for on Reports, made within four hours, signed like a weekly report.

A The pack
Kind, ingredient, days.

B Ask
Made within four hours.

C Made
Files, SHA-256, signatures.

D Waiting
Until the next run.

HOW TO ASK FOR A PACK

1. Open **Reports**, then **Packs**. Choose the pack.
2. **PSUR pack** (reviewers and administrators): choose the ingredient. Its days start at its EURD interval, up to today, or the last 12 months when it has none.
3. **Inspection pack** (administrators only, and only they see it): the last 12 months. Change the days if needed: at most five years, the first day not in the future. Press **Ask for the pack**.
4. When it is made, Telegram tells you and the administrators, with the PDF. Download both files and sign it as a weekly report.

WHAT EACH PACK HOLDS

PSUR pack	The EURD interval. §3 Regulatory actions: every notice naming the ingredient or its class, by country, with its decision, its report to the authority and its signal, and each country's answer. §4 Label changes, each against our label. §11 Literature: possible case reports first, with their dates, and the searches. §15–16 Signals: stage, outcome and every step. The screening annex. Findings that do not concern us are counted, and listed with their reason in the Excel file.
Inspection pack	Coverage: each page of hers and whether the app reads it. The screening log. Every decision, and every signature (weekly reports, packs and signals) with whether what was signed still matches. Every report to the authority, withdrawn ones too. Every weekly report with both SHA-256. The archive checks. The audit log, counted per table. The people and their roles.

Limits

At most two packs waiting per person and five in all. The same pack asked for again while it waits is the same request. A test run never makes one.

If it takes long

A pack not finished in one run goes on in the next. After three tries it shows **Not made** with the reason: ask for it again.

Never overwritten

Kept in the locked archive with the SHA-256 of each file. It is read from the same records as the screens and the weekly reports.

06 Telegram: what PHAROS sends

Messages carry the authority's public notice only: never a comment, never a decision.

MESSAGE	ITS NAME UNDER WHAT I RECEIVE	WHAT IT CARRIES
Immediate message	Ingredient notices, immediately	A new notice that names one of our ingredients, as soon as it is found: the ingredient, the country and authority, the type, the title as published, and a link to it.
Class digest	Class-wide notices, daily digest	Notices that name only a drug class, together in one message once a day, after 09:00 Cairo. At its end, the **Possible case reports** found since the last one (page 7).
New items	New items on the authorities' pages, once a day	Once a day, after 09:00 Cairo: how many items each country published since the last message, with a link to Sources. Nothing is sent on a day with nothing new.
Morning reminder	Every reviewer and administrator	After 07:00 Cairo: findings due to the Egyptian Drug Authority and signal steps, late or due within 2 days, each with a link. Nothing when nothing is due (page 9).
For administrators	Source health alerts	A source that stopped working. On Sunday morning, the weekly report PDF. A pack made, or not made, also to whoever asked for it.

Never on Telegram: other NCBI papers, and anything found by a look into the past (History). While PHAROS is in dry run it writes every message down and sends none; **Me** shows which, under Real Telegram messages (administrators).

CONNECT TELEGRAM

1. Open **Me**: your name at the top right. Press **Connect Telegram**.
2. Open the link on the phone where you use Telegram and press **Start** in the chat. The link works once and for 24 hours.
3. Under **What I receive**, choose your messages.

INSTALL PHAROS ON AN ANDROID PHONE

1. Open **pharos-satopharma.pages.dev** in Chrome and sign in.
2. Open Chrome's menu (the three dots) and press **Add to Home screen** (on some phones **Install app**), then **Install**.
3. PHAROS opens from its own icon, full screen, at Ingredients. The tabs sit at the foot of the screen, in reach of the thumb.

On an iPhone: Safari, then Share, then **Add to Home Screen**. The phone app is the same website: it needs a connection, and every screen is always the latest one.

07 People and Me

PEOPLE (ADMINISTRATORS): INVITE A PERSON

1. Press **Invite a person**.
2. Write the full name and work email. Choose the role.
3. Press **Send the invitation**. They get an email to choose a password.

In the table: change a **Role**, switch **Can sign in** off to stop someone at once, and choose their **Messages**. Nobody can sign in without an invitation.

ME: YOUR OWN ACCOUNT

Telegram	Connect your chat, or another one.
What I receive	Your Telegram messages.
Real Telegram messages	Administrators: a test, dry run on or off.
Password	Set or change it. Signing needs it.
This device	Light or dark, and Sign out.

THE THREE ROLES

Reader
Sees every screen and every report.

Reviewer
Also records decisions, reports to the authority and signal steps; signs reports; asks for PSUR packs.

Administrator
Also manages the watchlist, drug classes, sources and people, and asks for inspection packs. Dr Sama Mosaad's role.

08 For the SOP and the master file

What PHAROS covers, a routine to screen with it, and the record it keeps. Written to be lifted into the SOP and the pharmacovigilance system master file.

SCOPE

PHAROS screens, for the active ingredients on its watchlist and their drug classes: the safety publications of the 25 reference regulatory authorities (their DHPC, safety-notification and drug-database pages) and of other authorities; the newsletters those authorities send to the pharmacovigilance mailbox; the product information (SPC) of products with those ingredients; and the literature in PubMed and PubMed Central. Each source is read in its own language. A page PHAROS cannot read is marked on screen and listed in the weekly report, to be checked by hand. For a finding that concerns us it keeps the five-day clock and the signal steps.

A ROUTINE TO SCREEN WITH PHAROS

WHEN	WHAT TO DO
Every working day	**Sources**: on each card with new items, read them, open every page marked Not read by the app, then press Mark as looked at. Read the day's Telegram messages and act on the morning reminder.
Every week	**Ingredients**: for each watched ingredient, open its screen for **Last week**. Record a decision on every mention, label change and possible case report; check by hand every country that says so; read the literature and compare the counts with NCBI.
Every Sunday	**Reports**: download the weekly report, PDF and Excel; file both with their SHA-256; sign it; work through section 06, To check by hand.
When a finding concerns us	Record **Concerns us** with a comment. Report it to the Egyptian Drug Authority within five days and press **Sent to the authority**. Take its signal through its steps.
When an ingredient is added	Check its names and class words, test them against the archive, press Confirm, give its Japan code, and wait for **Ready** on its row.
For a PSUR or an inspection	Ask for the pack on **Reports**; sign it once it is made.

THE RECORD PHAROS KEEPS

Originals

Every notice and its PDFs, as found, in a locked archive nobody can change. A sample is re-checked every week.

Every read and look

Every check of every source, worked or failed: the screening log. Who looked at each country, and when.

Every decision

Who, when, what and why, with every report to the authority and signal step. Never edited: a new one follows.

Every signature

Who signed which file, meaning what, with its fingerprint. Nobody can change the audit log.

CHANGED IN NOVEMBER 2026, AND KEPT

Removed screens: Notifications and its Excel export, the notice page, Oversight. **Back inside the screens:** the signal steps, our label, the sign-off, and the PSUR builder as the PSUR pack. The EURD list, EMA's literature monitoring and a morning reminder run again.

Kept: all their data, with every decision and every signature; no record was deleted. Every source, the label watch, the PRAC agendas and minutes, NCBI literature and the check of the past still run. An old link to a removed screen opens Ingredients.

REMEMBER

1. PHAROS finds and shows. A person decides.
2. Nothing found counts only when every read worked. Otherwise, check by hand.
3. A decision is never edited. You record a new one after it.
4. A finding that concerns us reaches the Egyptian Drug Authority within five days.
5. Every date and time, on screen and in the reports, is Cairo time.
